

## MAINTENANCE OF THE LIGHTED MIRROR CABINET

The lighted mirror cabinet is made of powder-coated steel, so cleaning with mild detergents is sufficient.

Do not use abrasive powders, scouring liquids, or solvent-based cleaners, as they may damage the painted surface. Test the suitability of the cleaning agent on a small, inconspicuous area first.

Mirror surfaces can be cleaned with standard glass cleaners.

Regularly check the tightness of the hinge screws and tighten them if necessary.

## REPLACING A LED TUBE

You can replace a faulty LED tube yourself without any tools:

1. Before installation, ensure that the power to the fixture is turned off and that the installation area is clear of obstacles.
2. To remove the light cover, gently press the lower edge of the plastic cover upwards with your thumb.
3. Make sure the illuminating plastic surface of the LED tube points in the desired direction after installation.
4. Verify that the LED tube is compatible with the fixture in question.
5. Turn on the power and check that the LED tube functions properly.
6. Recycle the used tube as WEEE (Waste Electrical and Electronic Equipment) at a designated E-Waste recycling point.
